

Nissan

The order pickers manufactured by Nissan are based on a modular design so as to provide operators and owners the most affordable solutions to the widest range of demands in the warehousing business. A few of the options include tiller arm or wheel steering, rising and fixed driver platforms and low and high fork options.

To be able to achieve extreme productivity, you operator needs a reliable and durable equipment capable of raising nearly 15 tons in a single shift. The order picker line made by Nissan have been meticulously engineered with the operator's requirements in mind. They offer the utmost safety features to create an efficient and comfortable working atmosphere and increase performance. These kinds of equipment function at both medium and low levels with long forks to greatly enhance workflow by handling up to 3 pallets or 2 roll cages at a time. The operator platform rises around 95 cm in less than 2.5 seconds to enable for quick access to picking positions.

At high levels, the lift speed is fast and there is easy access to the forks from the cab and the picking position. AC power guarantees instant response to the operator's slightest command. As well, every braking movement really helps to recharge the battery for a much longer shift. More uptime means more productivity. All Nissan order pickers enjoy easy battery changes and on-board fault diagnostics. These design features really contribute to increased uptime of the machine.

Ergonomic design is implemented at all levels. Like for instance, at medium and low levels, select the steering option that is best for your application. The power assisted wheel provides accurate and effortless control. In applications where the operator walks beside the truck, the tiller arm option can be the right alternative. In this position, the brake is applied every time the arm is raised vertically. Once raised, it gives the operator ample space to stand on the truck.

When picking positions are close together, the "side drive" option allows the operator the chance to walk alongside the machinery and control the truck from either side. The operator could achieve this "straight line" operation so as to guarantee accurate forward and backward travel. At both medium and low level, the step height is only a few centimeters from the ground for easy access. Also, the rising platform options enable an easy "walk around" space.

Cab access is easy and quick at a high level. Moreover, the floor has added cushioning for improved operator comfort. What's more, the controls are carefully located for simple operation and to help ensure maximum output.
